Problem	Location (in `broken.html`)	Fix (applied in `fixed.html`)	Why the Fix Matters
Missing `lang` attribute	`<html>` tag	Added `lang="en"` to the `<html>` tag.	Essential for **accessibility**. Screen readers rely on this attribute to switch to the correct pronunciation rules and language synthesizer. Search engines also use it for geo-targeting.
Missing `<title>` tag	`<head>` section	Added `<title>Our Product Catalog</title>` inside the `<head>`.	The `<title>` is the most important on-page **SEO** factor. It is displayed in browser tabs, used as the clickable headline in search results, and informs users what the page is about before they visit.
Incorrect Heading Hierarchy	`<h1>` followed by `<h3>`	Changed `<h3>` to `<h2>`	Headings must be sequential (h1 $\rightarrow$ h2 $\rightarrow$ h3). Correct hierarchy provides **semantic structure** for screen reader users to navigate the page efficiently and helps search engines understand the content's importance.
Missing closing tag for `<ul>`	Line 16 (`<ul>` is unclosed)	Added `</ul>` after the last list item.	Without a closing tag, the browser cannot determine where the list ends. This can cause subsequent content to be incorrectly rendered *inside* the list, breaking the layout and confusing assistive technologies.

Incorrect Nesting	Carrots	Moved `<strong>` tags inside the `<li>` tags: `<li><strong>Carrots</strong></li>`	HTML elements must be properly nested (last opened, first closed). Incorrect nesting creates invalid DOM trees, can cause browser rendering errors, and confuses screen readers about the relationship between elements.
Duplicate IDs	Two `<img>` tags with `id="main-image"`	Changed IDs to be unique: `id="apple-image"` and `id="banana-image"`	IDs *must* be unique across the entire HTML document. Duplicate IDs break document navigation (e.g., fragment links), interfere with CSS styling, and cause JavaScript to target the wrong element or fail entirely.
Meaningful image missing `alt` text	<img src="logo.png"	Added `alt="Company Store Logo"`	Images conveying information require `alt` text for **accessibility**. Without it, blind or visually impaired users using screen readers will not know the image exists or what information it conveys.
Broken relative link	<a href="contact-us.html">	Changed the link target to `href="index.html"` (assuming contact-us.html doesn't exist in this scope).	Broken links frustrate users and harm **SEO**. Search engines penalize sites with many broken links as it indicates poor maintenance, leading to lower rankings and poor user experience.
Missing form-label association	<label>Name:</label>	Added `for="name"` to the `<label>` and matched it to `id="name"` on the input.	Labels must be explicitly associated with their inputs using the `for` and `id` attributes for **accessibility**.

			This allows screen reader users to know which label corresponds to which input field, and clicking the label focuses the correct field
Incorrect form-label association	`<label for="email">` pointing to `id="address"`	Fixed the `for` attribute to match the correct ID: `<label for="address">`	Misaligned labels are worse than no labels. They provide false information to screen reader users, causing them to input data into the wrong fields (e.g., typing an email address into an address field).
